Submission Report

Project: Globe Trotter – Travel Planner

Submission Date: 22 August 2026

Problem Statement: Travel & Tourism / Smart Travel Management

Team Name: [-]

Executive Summary

GlobeTrotter is a responsive travel management web application designed to make trip planning simple, organized

and collaborative. Instead of switching between separate apps for destinations, schedules, budgets and sharing, users can manage the complete journey from one interface. The platform combines trip creation, day-wise itinerary planning, expense tracking, destination exploration, profile statistics and shared-trip viewing in a single workflow.

The solution is designed with a clean, mobile-first interface and a modular data structure so that it can be extended with dynamic APIs, a database and Odoo-based backend services. This approach aligns with the hackathon's emphasis on responsive UI, input validation, dynamic data and proper Git-based collaboration.

Team Members

1. Problem Statement & Proposed Solution

Problem Context

Travel planning becomes difficult when information is distributed across multiple platforms. A traveler may use one service for destination discovery, another for accommodation or activities, a spreadsheet for expenses, and a calendar for scheduling. This fragmentation increases the chance of missed activities, duplicate planning, unclear budgets and poor group coordination.

Our Proposed Solution

GlobeTrotter provides a centralized digital workspace where users can discover destinations, create trips, build day-wise itineraries, record estimated costs, monitor budgets and share a read-only trip plan. The design focuses on reducing the number of steps required to move from an idea to a practical travel plan.

Primary Objectives

- Create a single place to organize trips, dates, destinations, activities and costs.
- Make destination discovery more visual and easier to understand.
- Provide clear budget visibility before and during a journey.
- Support group coordination through a shareable itinerary.
- Use responsive design so the application remains useful on desktop, tablet and mobile screens.
- Maintain a modular architecture that can be connected to dynamic APIs, database services and Odoo modules.

Target Users

- **Individual travelers:** plan personal trips and manage expenses.
- **Friends and families:** coordinate shared schedules and destinations.
- **Travel planners:** organize multi-city journeys with structured packages.
- **Administrators:** manage trip/package information and destination content.

Hackathon Alignment

The official Odoo x LDCE Ahmedabad Hackathon '26 information highlights responsive and clean UI, robust input validation, intuitive navigation, dynamic/real-time data sources and proper Git version control as important requirements. GlobeTrotter's design directly addresses these areas and leaves a clear path for replacing prototype data with live APIs and a backend database

2. Core Features & Functionalities

1. Authentication & User Profile

OTP-based signup/login concept, profile management and user statistics such as total trips, countries/cities visited and preferred travel style.

2. Interactive Dashboard

A centralized dashboard presents total trips, planned cities, estimated budgets, travel days and upcoming journeys in a quick-to-understand visual format.

3. Smart Trip / Package Creation

Users or administrators can create a package with destination, start date, end date, description, budget and related travel information. Date validation prevents invalid ranges.

4. Image-Enhanced Location Search

Location entry is designed to provide destination suggestions with visual thumbnails, helping users recognize the intended city, state, country or travel destination before selection.

5. Day-by-Day Itinerary Builder

Each trip can be divided into dates and activities. Activities can include time, title, description, location and estimated cost, making the plan practical rather than just informational.

6. Calendar Integration

A visual calendar/timeline presents activities according to their planned dates and times, reducing schedule conflicts and making the full trip easier to understand.

Example Travel Flow

Step	User Action	System Result
1	Sign in / create profile	User enters the travel dashboard
2	Select destination	Location suggestions and visual information appear
3	Create trip	Dates, destination and budget are stored

4	Build itinerary	Daily activities are added to the trip
5	Track expenses	Budget usage and remaining amount are displayed
6	Share trip	A read-only trip view can be shared with others

3. Core Features, Budgeting & Collaboration

7. Intelligent Budget Tracking

- Expense categories can include Transport, Stay, Activities and Meals.
- Estimated spending can be compared against the total trip budget.
- A progress indicator provides immediate visual feedback on budget usage.
- The remaining amount helps users make better spending decisions.

8. Explore Module

The Explore section is designed for destination discovery. Users can search cities, cultural places, food experiences and activities, then add useful items to a trip. The module can later consume live travel APIs or Odoo-managed destination records instead of relying on static prototype data.

9. Shared Itinerary

- Generates a read-only view of a selected trip.
- Shows destination, dates, daily schedule and budget summary.
- Designed for easy sharing with friends, family or co-travelers.
- Reduces the need to repeatedly send screenshots or manually copy schedules.

10. Responsive Navigation & User Experience

- Mobile-friendly sidebar/navigation.
- Responsive cards and grids for different screen sizes.
- Clear buttons, spacing and visual hierarchy.
- Fast client-side interactions without unnecessary page reloads.
- Consistent visual language across dashboard, trips, itinerary and profile screens.

11. Validation & Reliability

The application validates important user inputs such as trip dates and required fields. The architecture is prepared for stronger server-side validation, authentication, database constraints and API error handling when the backend is connected.

12. Odoo Integration Readiness

GlobeTrotter can be mapped to Odoo models such as Users, Trips, Destinations, Activities, Expenses and Shared Itineraries. Odoo's integrated, modular application ecosystem makes it suitable as a future business-management/backend layer for the platform.

Suggested Odoo Data Models

Model	Important Fields
Trip	name, destination, start_date, end_date, budget, status
Itinerary	trip_id, date, time, activity, location, cost
Expense	trip_id, category, amount, note, date
Destination	name, country, image, description, tags
User/Profile	name, mobile/email, preferences, travel statistics

4. Technical Architecture & UI/UX

Technology Stack

Layer	Technology / Approach	Purpose
Frontend	HTML5, CSS3, JavaScript ES6+	UI, interactions and client-side logic
Styling	CSS Flexbox, Grid, responsive media rules	Mobile-first responsive design
Data Prototype	JavaScript objects / JSON structure	Initial application state and demonstration
Version Control	Git + GitHub	Team collaboration and change tracking
Future Backend	Odoo / API / Database	Persistent users, trips, activities and expenses

Architecture Overview

Presentation Layer	Application Logic	Data / Backend Layer
Dashboard Trip pages Itinerary Budget Explore Profile	Validation Trip calculations Search/filter Calendar logic Sharing logic	Odoo Models / APIs Database Authentication Destination data

UI/UX Design Principles

- Clean and consistent layout with clear navigation.
- Visual cards and destination imagery for quick recognition.

- Glassmorphism-style surfaces, gradients and soft shadows for a modern appearance.
- Responsive behavior for desktop, tablet and mobile devices.
- Short interaction paths: users should reach trip creation, itinerary and budget information with minimal clicks.
- Readable typography, spacing and feedback states to improve usability.

Future Enhancements

- Live maps, geolocation and route planning.
- Real-time destination, weather and transport APIs.
- Persistent Odoo/database storage with role-based access.
- Collaborative editing for group trips.
- AI-assisted itinerary suggestions and budget recommendations.
- Offline/PWA support for travel situations with limited connectivity.

5. Team Contribution, Deliverables & References

Team Contribution Plan

Member	Suggested Responsibility	Contribution Evidence
Team Leader	Project coordination, integration, final submission	Git commits + issue/task tracking
Member 1	Frontend/UI and responsive design	Git commits + UI modules
Member 2	Trip, itinerary and budget logic	Git commits + feature modules
Member 3	Testing, documentation and backend/Odoo readine	s Git commits + testing/docs

GitHub Repository Reference

Repository: <https://github.com/mayurkukadiya2007-cpu/Globe-Trotter/tree/main#globe-trotter>

The repository should contain the latest project source, README/documentation, meaningful commit messages and the work contributed by each team member. The official hackathon information specifically emphasizes proper Git version control and that collaboration should involve the team rather than one person managing the repository alone.

Declaration

We submit Globe Trotter as our proposed solution for the Odoo x LDCE Ahmedabad Hackathon '26. The project has been developed with emphasis on usability, responsive design, teamwork, version control and future integration with dynamic backend services.
